

Weather Monitoring

Abstract:

Climatic change and environmental monitoring have received much attention recently. The aim of this project is to design and develop a user-friendly weather monitoring system that examines weather condition of the surroundings like temperature and humidity along with time stamp, and thus makes it available to the user from any part of the world.

The proposed design implemented system consists of a LM35 Temperate sensor, DS1307 (RTC) can be operated by the AM3358 SoC to retrieve the data from them along with time stamp using I2C protocol and it send data to monochrome 16x2 LCD display.

With this system, it becomes simple and effortless to visualize the changing environmental conditions like relative humidity, temperature. The applications are in cold storages, server rooms, hospital labs and industrial appliances according to requirement.
